The proposed project would remove and replace the existing steel truss / timber bridge, along with the intermediate piers. A new 2-span bridge will be constructed, consisting of driven steel piles, concrete piers / abutments, and prestressed beams. The new bridge would be placed along the same alignment. Both spans will be 100-feet long and the intermediate pier will be located outside of the thalweg of the channel. Riprap will be placed to protect the abutments from scour.

5. WHAT OTHER ALTERNATIVES were considered to accomplish the stated purpose of the project? Why was the proposed alternative selected? Refer to section C5 in the instructions.

Alternatives included “no action”, a single span truss bridge and multiple span steel bridge. Because of the deteriorated condition of the bridge, the “no action” alternative is not viable. The single span steel bridge option was ruled out because the cost of a single span truss rendered the option cost prohibitive. The concrete bridge design alternative was chosen over the steel option due to cost, reliability, and ease of construction.

6. NATURAL RESOURCE BENEFITS OR POTENTIAL IMPACTS. Please complete the information below to the best of your ability.

* Explain any temporary or permanent changes in erosion, sedimentation, turbidity, or increases of potential contaminants. What will be done to minimize those impacts?

The existing bridge has two sets of large piers in the river, which impact flow during high water. The large piers will be replaced by a single multi-pile intermediate pier that will be narrower than the existing piers and will improve flow through the crossing. The new bridge will be longer than the existing bridge, which will also improve flow through the crossing. Silt fence will be installed between excavation and stream channel, and disturbed areas will be re-vegetated.

- Will the project cause temporary or permanent impacts to fish and/or aquatic habitat? What will be done to protect the fisheries?

Riprap will be installed to mitigate site disturbance, re-vegetate disturbed areas, maintain channel for fish passage.

- What will be done to minimize temporary or permanent impacts to the floodplain, wetlands, or riparian habitat?

Wetland and riparian habitat disturbance will be minimized by restricting excavation and construction activities to the existing road right of way, and only disturbing what is necessary for construction.

- What efforts will be made to decrease flooding potential upstream and downstream of project?

The existing intermediate piers will be replaced by a smaller pier and the bridge length / low beam elevations will be designed to accommodate no rise in water surface elevations.

- Explain potential temporary or permanent changes to the water flow or to the bed and banks of the waterbody. What will be done to minimize those changes?

The existing bridge is a multiple span bridge with piers in the channel, which negatively affects the flow of water in the river. The existing piers will be replaced with piles that are smaller, which should improve flow through the crossing. The new bridge will be longer than the existing bridge and the opening will be designed to accommodate no rise in water surface elevations.

- How will existing vegetation be protected and its removal minimized? Explain how the site will be revegetated. Include weed control plans.

Vegetation disturbance will be minimized by restricting excavation and construction activities to the existing road right of way, and construction easements necessary for a work bridge, and only disturbing what is necessary for construction. All equipment will be weed washed prior to mobilization to the project site.
